

Exp 9 : Create a Snapshot of a VM and Test it by loading the Previous Version/Cloned VM using a virtual box.

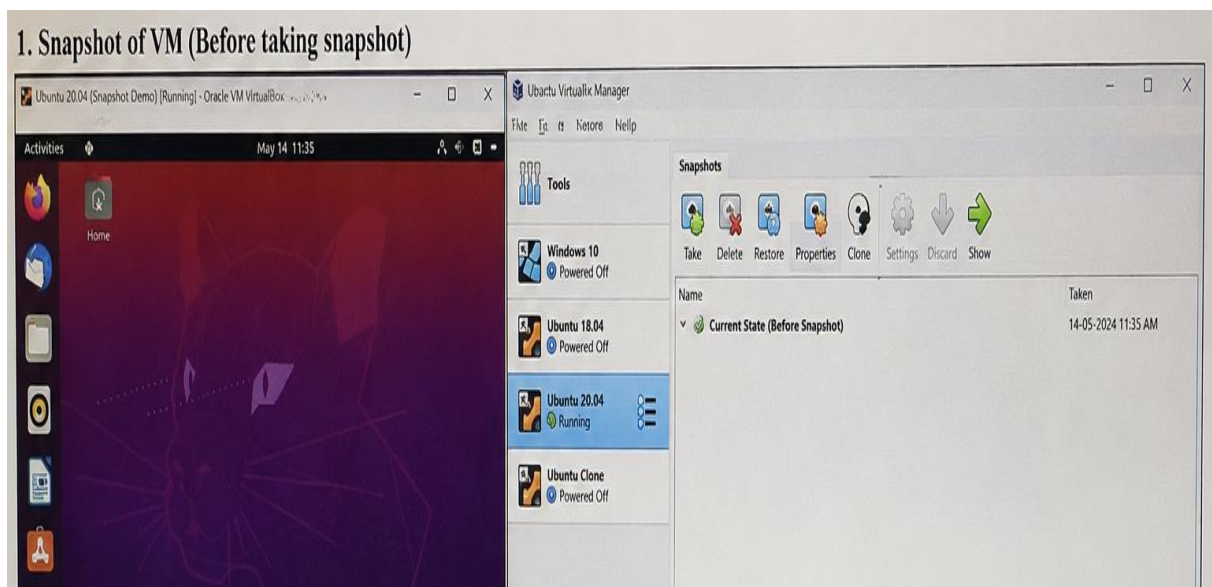

Aim

To create a clone of a VirtualBox virtual machine (VM), and test recovery by (a) booting the cloned VM, and (b) restoring the VM to a previous state using VirtualBox snapshots. Verify that the clone is functional and the snapshot restore returns the VM to the earlier state.

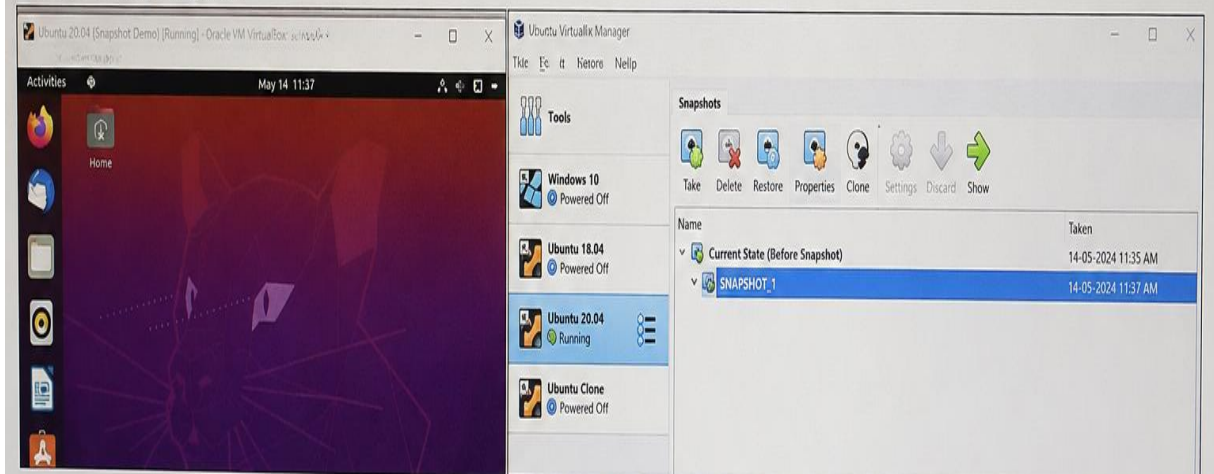

Procedure :

- 1. Select the source VM (OriginalVM).**
- 2. (Optional) Create a snapshot of OriginalVM named pre-clone-snap.**
- 3. Power off OriginalVM.**
- 4. Create a clone of OriginalVM → ClonedVM (register it in VirtualBox).**
- 5. Start ClonedVM and verify OS boots and network.**
- 6. Make a visible change to OriginalVM (e.g., create a text file or change hostname).**
- 7. Restore OriginalVM to pre-clone-snap (or boot cloned copy made earlier).**
- 8. Confirm the change is gone after restore (i.e., previous version is loaded).**
- 9. Record results, timestamps, and any issues.**

Output

2. After Taking Snapshot

Snapshot successfully created.

3. Testing by Loading the Previous Version / Cloned VM

Previous version loaded successfully.

Result:

A snapshot of the Virtual Machine was successfully created and restore
